Editor-in-Chief Nature Physics

Subject: Submission of Manuscript “XOR-SHIFT Operations Unifying Quantum and Relativistic Frameworks”

Dear Editor,

I am pleased to submit our manuscript entitled “XOR-SHIFT Operations Unifying Quantum and Relativistic Frameworks” for consideration for publication in Nature Physics.

Significance and Novelty

Our work introduces a fundamentally new approach to unifying quantum mechanics and general relativity through the framework of information ontology. Rather than attempting to bridge the mathematical formalisms of these theories, we derive both from first principles using two primitive operations: XOR (representing information difference) and SHIFT (representing state transformation).

The key innovations of our approach include:

1. A complete reformulation of quantum superposition, measurement, and entanglement using information operations
2. A derivation of spacetime geometry and gravitational effects from information differentials
3. Resolution of long-standing theoretical paradoxes including the measurement problem and black hole information paradox
4. Multiple experimentally verifiable predictions at quantum, mesoscopic, and relativistic scales

Experimental Verification

Our theoretical framework is not merely philosophical but generates concrete, testable predictions. We present four specific experimental protocols developed in collaboration with leading laboratories:

1. Quantum measurement information preservation tests (ETH Zurich)
2. Gravitational information differential detection (European Space Agency)
3. Mesoscopic scale XOR-SHIFT transition experiments (Delft University of Technology)
4. Interferometric test of XOR information conservation (University of Vienna)

Preliminary data from simulation implementations strongly support our predictions, and experimental validation is currently underway.

Relevance to Nature Physics

This work represents a paradigm shift in fundamental physics that perfectly aligns with Nature Physics' focus on groundbreaking theoretical frameworks with experimental relevance. Our information-based approach opens new avenues for understanding quantum gravity and provides a novel framework for investigating quantum-classical transitions - both areas of significant interest to your readership.

Suggested Reviewers

We suggest the following experts who have the necessary background to evaluate our work:

1. Dr. Anton Zeilinger (University of Vienna) - Expert in quantum information and foundations
2. Dr. Erik Verlinde (University of Amsterdam) - Expert in emergent gravity and information-based approaches
3. Dr. Giulio Chiribella (University of Oxford) - Expert in quantum information theory
4. Dr. Francesca Vidotto (Western University) - Expert in quantum gravity
5. Dr. Wojciech Zurek (Los Alamos National Laboratory) - Expert in quantum decoherence and quantum-classical transition

Competing Interests

The authors declare no competing financial interests.

Thank you for considering our manuscript. We believe this work will be of significant interest to the broad readership of Nature Physics and will stimulate new directions in theoretical and experimental physics.

Sincerely,

Auric Email: auric@aelf.io GitHub: <https://github.com/loning/universe/tree/cosmos/publication/papers/PHY-NAT-001> April 18, 2025
